

EXPERIMENT 4B

ROLL NO: 240701244

NAME: KAVITHA R

Conduct task analysis for an app and document user flows. Create corresponding wireframes using Dia.

Aim

- To conduct task analysis for an application.
- To understand the steps a user follows while completing a task in the application.
- To document the user flow of the travel booking process.
- To create wireframes and flow diagrams using Dia.

Tool Used

Dia

- Dia is an open-source diagram creation tool used for drawing flowcharts, wireframes, and system diagrams.
- It provides different shapes such as rectangles, diamonds, arrows, and ellipses to represent processes and decisions.
- It helps in visualizing the workflow of an application clearly.

Task Analysis

Task analysis is the process of breaking down a user activity into smaller steps to understand how a user interacts with an application.

For this experiment, the TripGo travel booking application is considered. The main goal of the user is to search for a destination and book a travel package.

Main Tasks

- Opening the application or website
- Logging into the account
- Searching for a destination
- Selecting a travel package
- Entering traveler information
- Choosing a payment method
- Confirming the booking

Task analysis helps in identifying user actions and improving application design.

User Flow

User flow represents the path a user follows to complete a specific task in the application.

The user flow of the TripGo booking process is explained below.

1. The user starts the application or website.
2. The user enters email and password to log in.

3. After login, the user searches for a destination location.
4. The user selects the preferred destination from the available options.
5. The application displays travel package details.
6. The user decides whether to book the package or exit.
7. If the user chooses to book, they enter traveler details.
8. The user selects a payment method.
9. The user enters the payment details and The booking is confirmed and a booking confirmation message is displayed.

This flow ensures that the booking process is clear and easy for the user.

Flowchart Representation

The flowchart represents the user flow of the TripGo travel booking application. It starts with the user opening the application or website and logging into the system by entering the email and password. After successful login, the user searches for a destination and selects the preferred location.

Once the destination is selected, the user can view the available travel package details. A decision step is included to determine whether the user wants to book the selected package. If the user chooses not to proceed with the booking, the process ends.

If the user selects the option to book the package, the user enters the traveler details, selects a payment method, and provides the payment information. After confirming the booking, the system displays a booking confirmation message and the process ends successfully.

Conclusion

This experiment helped in understanding the concept of task analysis and user flow in an application. The steps involved in the travel booking process were identified and represented clearly using a flowchart. Using Dia, the workflow of the application was visually organized, making it easier to understand the sequence of actions performed by the user.
