

EXPERIMENT 3B

ROLL NO: 240701244

NAME: KAVITHA R

Create a prototype with familiar and unfamiliar navigation elements and evaluate ease of use with different user groups using Wireflow.

Aim

The aim of this experiment is to design a prototype containing both familiar and unfamiliar navigation elements and visualize the navigation flow using Wireflow.

Introduction

Prototype design helps visualize an application's structure before development. Wireframes show screen layouts, while wireflow shows navigation between screens. In this experiment, a **TripGo** travel booking app prototype is designed using Wireflow.

Tools Used

1. Proto.io

Proto.io is a prototyping tool used to design interactive mobile application interfaces.

2. Wireflow

Wireflow is an online tool used to create wireframe flow diagrams and visualize navigation between screens.

Prototype Design

The prototype designed in this experiment represents a travel booking mobile application named **TripGo**.

1. Login Screen

The login screen is the entry point of the application. Users enter their email and password to access the system. This screen allows authentication before accessing other features of the application.

2. Explore Places Screen

After logging in, users are taken to the explore screen where they can browse different travel destinations. Destinations such as Ooty Hill Station, Goa Beach, Mysore Palace, Jaipur, Taj Mahal, and Andaman Islands are displayed.

3. Destination Details Screen

When a user selects a destination, the application displays detailed information about the place. This screen includes trip duration, transport facilities, hotel details, and package price.

4. Payment Screen

In this screen, the user selects a payment method to complete the booking. Different payment options such as UPI, credit card, debit card, and net banking are available.

5. Booking Confirmation Screen

After successful payment, the application displays a booking confirmation message. This screen shows the destination name, payment amount, and booking status.

Wireflow Design

The wireflow diagram shows how a user moves from one screen to another while using the application.

The navigation flow of the TripGo application is as follows:

Login Screen → Explore Places Screen → Destination Details Screen →
Payment Screen → Booking Confirmation Screen

This flow helps understand the sequence of user actions during the booking process.

The wireflow diagram visually represents these screens and their connections, making it easier to understand the structure of the application.

Advantages of Using Wireflow

Wireflow provides several advantages during the design process:

- Helps visualize the navigation structure of an application
- Makes it easier to understand user interaction flow
- Improves communication between designers and developers
- Helps identify design problems before development
- Saves time and effort during the development process

Conclusion

This experiment helped in understanding how to design a prototype and represent navigation flow using Wireflow. It also helped in visualizing how users interact with different screens in a mobile application.
